INTRODUCTION

Historical Background

Since the arrival of automated data processing systems in the transportation industry in the early 1950's, the need for a rational set of variables for computerized transportation statistics has existed. Railways have always maintained a system for numerically identifying stations on their respective lines, although different departments within the same railway have often maintained different numbering systems to meet their respective needs.

In 1958, the Canadian National Railways implemented a station numbering system designed specifically to meet the needs of computerization. This system was adopted for internal use by all departments.

In 1973, the Canadian Freight Association issued a pamphlet containing the Standard Point Location Codes for Canada. This pamphlet was re-issued in 1976. As the Canadian Freight Association computerizes tariffs, the SPLC will be included as the origin/destination code. This manual is being issued jointly by the Canadian Transport Commission and the Canadian Freight Association with the co-operation of the Canadian SPLC Committee. It represents the most comprehensive attempt to standardize the origin/destination variable in transportation today.

System Methodology

The Standard Point Location Code (Canada) is designed to be part of the overall North American origin/destination coding structure. The prime objective has been to establish a coding structure that is rational, not only from a geographic sense, but also from a transportation and marketing view. Each SPLC designation is comprised of a six digit number based on a system of nesting recognized transportation points¹ and numbering them in a standard geographical pattern. For example, the SPLC for Brandon, Manitoba is 063495. Each digit is designed to represent a finer breakdown of area², as shown in the following series of diagrams:

¹ Some points are rate making points only and these points are marked with a reference mark in the point listings.

² This applies except for the last two digits, which are assigned together.

Individual Point	063495	-	Brandon, Manitoba
Country	0		Canada
Two Digit Area	06		Manitoba
Three Digit Area	063		Southwestern Manitoba (Region)
Four Digit Area	0634		Subregion
Six Digit Point	063495		Brandon, Manitoba

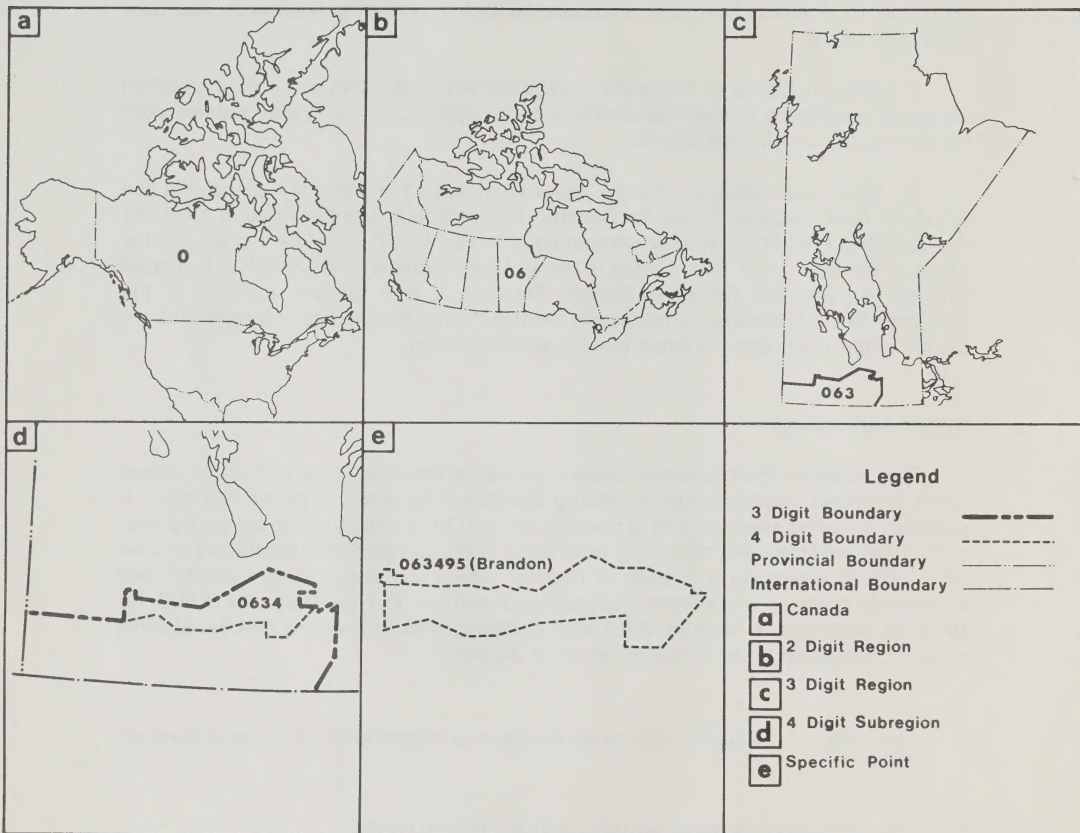

DIAGRAM 1

Unlike the United States' system, which is based exclusively on county boundaries, the Canadian system utilizes a number of different criteria in the development in both three and four digit boundaries. Because of the diversity of Canada, each area has a set of boundary criteria peculiar to that region. These criteria include political boundaries (i.e. county, municipal, district, provincial, etc.) rivers, lakes, rail lines and highways. Establishing an order of preference for boundary criteria would presuppose that Canada was comprised of a number of homogeneous units which of course, it is not. For example, in the Atlantic Provinces, County and District boundaries have more importance than highways and rail lines from a boundary point of view because in most cases, the interiors of these areas are not populous nor do they have a large transportation infrastructure. In the Prairie provinces, the most predominant features are highways and rail lines, so in this region they constitute the main criteria for boundaries at the three and four digit level.

This manual is divided into three volumes. Volume I, Atlantic Canada, covers the provinces of Nova Scotia, Prince Edward Island, New Brunswick and Newfoundland and Labrador. These areas cover all SPLC from 006000 to 019999. Volume II, Central Canada, covers the provinces of Ontario and Québec. These areas cover all SPLC from 020000 to 059999. Volume III, Western Canada deals with the provinces of Manitoba, Saskatchewan, Alberta and British Columbia as well as the Yukon and Northwest Territories. The provinces have SPLC running from 060000 to 099999. The Territories have SPLC running from 000000 to 005999. Appendix I is an alphabetic point listing (by province) of all points located within each volume.

The capacity of the Canadian system is 100,000 unique point designations. At present, only 16,400 of these possible points have been assigned. Therefore, in some cases whole groups at the three and four digit level are vacant. This allows the SPLC structure room for expansion.

This manual defines the Canadian SPLC at the two, three and four digit levels. The three and four digit levels are defined within each provincial section of the manual. The following map illustrates the Canadian SPLC at the two digit level.

**SPLC Canada

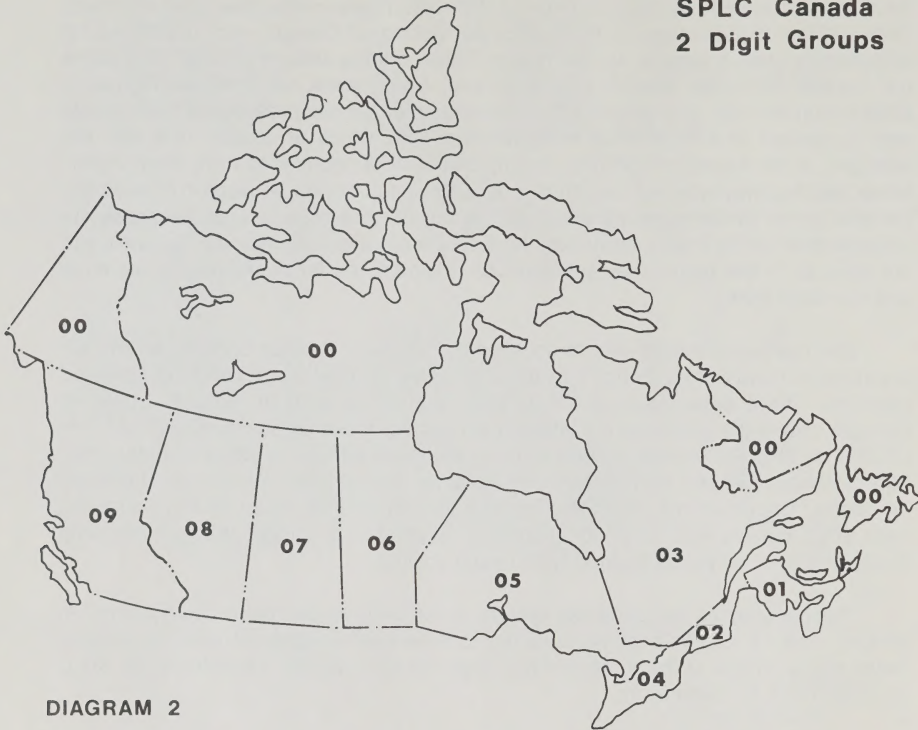

DIAGRAM 2

**2 Digit

- 00 - Newfoundland, Yukon Territory, Northwest Territories
- 01 - Nova Scotia, Prince Edward Island, New Brunswick
- 02 - Québec (south of the St. Lawrence and Ottawa Rivers)
- 03 - Québec (north of the St. Lawrence and Ottawa Rivers)
- 04 - Ontario (Ontario south of the County-District break - 04 is counties)³
- 05 - Ontario (Ontario north of the County-District break - 05 is districts)
- 06 - Manitoba
- 07 - Saskatchewan
- 08 - Alberta
- 09 - British Columbia

³ This applies except for the northern arm of Renfrew County. Pembroke is traditionally a gateway to the north and west, therefore it is part of Northern Ontario. Washago and Medonte, Ontario which are also gateways are given SPLC beginning with "05" which is Northern Ontario.

Each region is made up of six descriptive sections. These sections are described below. 1) **Three digit maps**, are maps of the provinces in question with boundaries drawn between the various three digit areas. For example, the Nova Scotia three digit map shows this province divided into each of its' four three digit areas. With reference to the Manual, these areas may be described as 010,011,012 and 013 (See map on page 18 of Volume I). 2) **Three digit boundary descriptions** provide a complete and precise description of the boundaries on the three digit map. The boundaries are described in a counter clockwise fashion beginning at the northeast corner of the region. The diagram below shows the procedure followed.

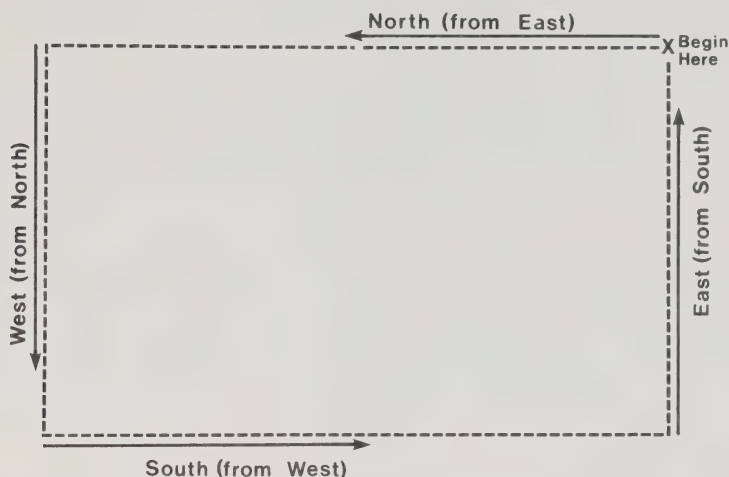

DIAGRAM 3

The boundaries are depicted in the manner shown above to allow simple interpretation of the boundary descriptions. 3) **Four digit maps** represent the four digit sub regions within a specific three digit region. Using the example of Nova Scotia, the four digit map for the region 010 is located on page 21 of Volume I. 4) **Four digit boundary descriptions** provide a detailed description of the divisions between the areas shown on the four digit map. These too are described in a counter clockwise fashion beginning at the northeast corner. 5) **Specific boundary definitions** are concerned with points located on the boundaries as they are defined. These correspond directly with the four digit boundary descriptions defined for each group. For the vast majority of cases, it is not necessary to decide which side of a boundary a location is on. There is no question in the case of rivers, lakes or political boundaries.⁴ Where the questions do arise however is when rail lines and highways are used in defining boundaries, since in most cases they pass through the middle of a location. The specific boundary descriptions define which part(s) of a group(s) boundaries are actually part of that group. 6) **The geographical point listing** accompanying each three digit group is a file of all Standard Point-Location Codes within that region sorted by SPLC number (by group).

4

In most cases when a river, lake or political boundary is used, the boundary is deemed to be part of both adjoining groups. Any instance where the situation is otherwise is well documented in the specific boundary descriptions for the region.

The Code is designed to accept structural changes with the major impetus for change coming from users of the system. When requesting an additional point, the user should forward his request to the Canadian SPLC Committee c/o the Canadian Freight Association in Montréal. When a request is made, the following information is required in writing in order to ensure its' proper location:

- (1) the actual name of the shipping point.
- (2) the county or district
- (3) a number of adjacent points
- (4) a specific latitudinal and longitudinal reference in order to eliminate confusion with places having similar names
- (5) any other pertinent information

After this information is processed by the SPLC Committee and a number assigned, it will be submitted to this office for confirmation. Further requests for information regarding the SPLC may be forwarded to this office. Additions, plus any other revisions will be published in cumulative supplements which will be released when necessary.

The Standard Point Location Code is transportation oriented and is designed to service the transportation industry. Because of this, it does not correspond directly with all political boundaries. Every user of transportation data has a need for some type of origin/destination code, thus a standard code is essential. It is anticipated this code will eliminate problems arising from intermodal and interline shipments and will improve the quality of data for use in internal industry operations and in transportation research.

Other SPLC Features

The Canadian Freight Association issues a magnetic tape containing all SPLC point listings. This tape, together with the record layout is available at two densities; 9 track, 800 BPI, and 9 track 1600 BPI. The record length is 100 with 20 records per block. Also, the SPLC tape file contains railway index numbers and other pertinent information not published in this Manual.

Enlarged blueprint maps containing all the SPLC three and four digit boundaries, with much more detail than the maps in this Manual are available through the Canadian Transport Commission, Traffic and Tariffs Branch. These maps are sold on a cost recovery basis.

This office thanks both the Canadian Freight Association and the Canadian SPLC Committee for their co-operation and assistance in the implementation of this manual.
